1. I think our team has done a good job staying up to date on what each other are working on. Discord has proven to work well for communicating this, maybe could do better with communicating whether we are actually doing well or struggling.

2. I think the display of the posterboards is the most important to benchmark 3. As our backend is currently able to retrieve documents from the user, displaying these documents does not require any interworking with other parts of the website. So I don't think this will cause issue with other parts of the site.

3. I can see setting up the different interfaces for Admin, students, etc being a problem. The Admin needs to be able to do a lot, this includes making edits to submitted work and allowing these edits to be seen by students. Also a tracking system that allows the student to see where the progress of their submitted work is.
